4. Block Diagram

RS-232C communication data consist of 8-bit data, no parity, 1-bit start-bit and 1-bit stop-bit.

5. Operation

Reset

FIM50 provides external low-active reset signal port. By setting the reset port low state, FIM50 could be initialized. The reset port is internally pull-uped to VCC.

Communication

FIM50 has two UART serial communication ports (RS232C and LVCMOS level) through those FIM50 communicates at the same time. These ports support 6 baudrate modes such as 9600, 14400, 19200, 38400, 57600, and 115200 bps.

FIM50 follows NITGEN Serial Communication protocol. For more detail information refer to the document “FIM ComProtocol.pdf”.

UART data consists of 1 start bit, 8 data bit, no parity bit and 1 stop bit.

Custom Data Area

FIM50 provides 64 Kbytes flash memory. Using this memory, host can save private data for specific usage. The caution is needed for the responsibility for reading, writing and erasing because user data area is given to the host.

IO Function

To be defined.
